## Abstract

Whilst the author believes the *raison d'être* of this manuscript is obvious, they do not believe that the scope is.

The *Theory of Functions* is rich and central to Mathematics. As such, we limit our scope here to definitions and graphs of univariate functions  $f : \mathbb{R} \rightarrow \mathbb{R}$ .

Whilst we include common equalities between different functions - say circular and exponential - what you will not find here are derivations of any sort. You will **not** find proofs **nor** set theoretic discussions of “jectivities”, binary relations, etc. Furthermore there is a purposeful lack of rigour in this / catalogue/; theorems are asserted as is, with no warranty and no proof. Finally, analytic concerns of limits and convergence are also dutifully ignored.

3.2.4. Square Wave .....	7

# 1. Elementary

These such functions are continuous on their domains and include taking **sums, products, roots** and **compositions** of finitely many [algebraic](#) or [transcendental](#) functions.

## 1.1. Algebraic

### 1.1.1. Polynomials

$$p(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_2 x^2 + a_0 = \sum_{k=0}^n a_k x^k \quad (1)$$

### 1.1.2. Rational

Much in the same way that  $\mathbb{Q}$  is defined as any element  $\frac{a}{b}$  where  $a, b \in \mathbb{Z}$ :

a function  $f$  is called a rational function if it can be written in the form:

$$f(x) = \frac{P(x)}{Q(x)} \quad (2)$$

where  $P(x)$  and  $Q(x)$  are polynomial functions of  $x$  and  $Q$  is not the zero function.

### 1.1.3. Power

Note that  $\sqrt{x}$  is not a polynomial because  $\sqrt{x} = x^{\frac{1}{2}}$  and  $\frac{1}{2} \notin \mathbb{Z}$ .

## 1.2. Transcendental

These are the analytic functions that **do not** satisfy a polynomial equation.

### 1.2.1. Exponential

$$e = \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^n \quad (3)$$

furthermore,

## 1. Elementary

$$\exp(x) = \lim_{n \rightarrow \infty} \left(1 + \frac{x}{n}\right)^n \quad (4)$$

graphically we have:

and by Euler's identity we have:

$$e^{i\theta} = \cos(\theta) + i \sin(\theta) \quad (5)$$

which relates the “circular” functions cosine and sine with the “exponential”  $\square$

### 1.2.2. Logarithm

setting  $y = e^x$  and swapping variables:  $x = e^y \implies y = \ln(x)$ . as such the logarithm and exponential functions are inverses of each other.

### 1.2.3. Trigonometric

### 1.2.4. Inverse Trig

### 1.2.5. Reciprocal Trig

### 1.2.6. Hyperbolic

### 1.2.7. Inverse Hyper

### 1.2.8. Reciprocal Hyper

### 1.2.9. Factorial

$x!$  and  $\frac{1}{x!}$

## 2. Non-Elementary

### 2.1. Transcendental

#### 2.1.1. Gamma

#### 2.1.2. Beta

#### 2.1.3. Riemann Zeta

#### 2.1.4. Error

$$\operatorname{erf}(x) = \frac{2}{\sqrt{\Pi}} \int_0^x e^{(-t)^2} dt \quad (6)$$

#### 2.1.5. Tetration

#### 2.1.6. Elliptic Integrals

#### 2.1.7. Trigonometric Integrals

$$\operatorname{Si}(x) = \int_0^x \frac{\sin(t)}{t} dt \quad (7)$$

$$\operatorname{si}(x) = - \int_{\infty}^x \frac{\sin(t)}{t} dt \quad (8)$$

$$\operatorname{Si} - \operatorname{si} = \frac{\Pi}{2} = \int_0^{\infty} \frac{\sin(t)}{t} dt \quad (9)$$

label as Dirichlet's integral

#### 2.1.8. Fresnel

$$\operatorname{S}(x) = \int_0^x \sin(t^2) dt, \operatorname{C}(x) = \int_0^x \cos(t^2) dt \quad (10)$$

## 2.2. Algebraic

#### 2.2.1. Bessel

#### 2.2.2. Hypergeometric

$$\operatorname{B}_0 + \operatorname{B}_1 z + \operatorname{B}_2 z^2 + \dots = \sum_{n \geq 0} \operatorname{B}_n z^n \quad (11)$$

where the ratio of successive coefficients is a rational function of  $n$ :

## *2. Non-Elementary*

$$\frac{B_{n+1}}{B_n} = \frac{A(n)}{B(n)} \tag{12}$$

## **3. Discontinuous**

### **3.1. Absolute Value**

### **3.2. Step**

#### **3.2.1. Heaviside**

#### **3.2.2. Floor**

#### **3.2.3. Ceiling**

#### **3.2.4. Square Wave**
